

Expert Workshop: Anonymization

24 November, Paris

Summary Report

The Anonymization Workshop brought together Drafting Group members and external experts to discuss anonymization and pseudonymization in the context of the GDPR. The grey area of anonymization with regards to health data was explored, particularly given the non-static nature of anonymized data. Experts presented classic and modern approaches to anonymization from a computer science perspective, as well as industry approaches. Of particular interest was the possibility of the anonymous use of personal data, which would simultaneously protect the privacy of the patients whilst maximising benefit when using data for health research purposes.
